**“Interplay between spectrally bounded
operators and Complex Analysis”**

Jueves 12 de noviembre de 2015
a las 13:00 horas en el seminario 222

Abstract:

Methods from Complex Analysis have been playing an important role in the study of spectrally bounded and spectrally isometric operators between Banach algebras in the past few years, not only through the subharmonicity of the spectral radius. In this talk, I intend to illustrate this interplay with Operator Theory by some recent advances in the structural investigation of these operators.
